

Synthetic Interviews on Auditable AI-Assisted Reading

Example Research Group | Synthetic Demonstration Paper | 2026

This document is fictional and exists only to demonstrate page-level evidence verification.

Abstract

This fictional qualitative study explores how early-career researchers describe trustworthy use of AI-assisted literature reading.

Methods

Twelve synthetic early-career researchers completed remote semi-structured interviews. The convenience sample spanned four fictional disciplines.

The analysts used reflexive thematic analysis. Interview notes were coded, discussed, and organized into candidate themes. No frequency threshold defined theme importance.

The participant was the unit of data generation, while themes represented interpretive patterns across the synthetic corpus.

Findings

Theme 1 - Traceability before fluency. Participants described page-linked audit trails as the main condition for trusting AI-generated summaries.

A representative fictional statement was: "A fluent answer is useful only when I can return to the exact page and check what was actually reported."

Theme 2 - Different evidence traditions need different checks. Participants rejected a single quality score for experiments, qualitative studies, and conceptual papers.

These themes are synthetic demonstrations of qualitative claim provenance, not findings about real researchers.

Reflexivity and limitations

The analysts designed both the interview guide and coding framework. Their preference for audit trails may have shaped the questions and interpretation.

The small synthetic convenience sample and absence of observational triangulation limit transferability.

Data and license

No real interviews were conducted. This synthetic document is released under CC0 and must not be cited as scientific evidence.
